

Pierre Laclaverie

Test Automation Programmer • QA • Image Processing

Montréal, QC

✉ pierre.laclaverie@gmail.com • [in linkedin.com/in/pierre-laclaverie/](https://www.linkedin.com/in/pierre-laclaverie/) • github.com/Laclaverie • laclaverie.github.io

PROFILE

Test automation programmer specializing in tool development for game production, working daily with CI/CD pipelines (TeamCity, GitLab CI). Experienced in architecting large-scale automated test systems (C++, C#) and developing image processing filters (C++/OpenCV). Involved across the full development lifecycle, from design to production delivery.

Programming:

C++, C#, Python, SQL

Tools & Frameworks:

xUnit/NUnit, Catch2, VS Test Adapter, Perforce, Git/GitLab, TeamCity, GitLab CI, Jira, OpenCV, Unity3D

Languages:

French (Native), English (Professional)

Status:

Permanent Resident

PROFESSIONAL EXPERIENCE

Note: Projects carried out in small teams (~3 programmers + a lead), from design to implementation, in collaboration with other teams to gather feedback on the shared technologies used.

Test Automation Programmer - Quality Assurance

May 2023 – Present

Ubisoft Montreal (Anvil Pipeline) — Shipped: AC Shadows, AC Black Flag Resynced

- Designed and evolved NPC Sanity across three releases (v1: AC Shadows, v1.5: its DLC, v2: AC Black Flag Resynced) — validation tool monitoring thousands of NPCs across 32 combinatorial states and quest setups, distributed across 6 machines (~120h runtime). Caught multiple regressions pre-ship. v2 generalizes dynamic CI test generation (Jira reports for Level Designers) to any high-combinatorial test type.
- Built a C# test-metadata system (user-provided and computed) for the monorepo shared by 5 productions, driving automatic test promotion in CI — monitored trial period, then assignment to the right stage (package-blocking, post-publish validation, daily, nightly). Automating repetitive tasks and improving user experience to get more developers engaged with test automation, from unit to functional to end-to-end tests (e.g. NPC Sanity).

- Maintained and evolved the Anvil Pipeline test framework: VS test adapter (run functional tests locally or on CI machines), automated CI integration for game package qualification (artifact collection, auto Jira creation). Technical bridge between game programmers and CI/CD infrastructure.
- Development of observability tools for CI tests and participation in a 3-person taskforce for prototyping a flaky test detection system.
- Weekly collaboration with teams across Europe, Canada, and Singapore; part of the test-automation hotline rotation — first line of support for game teams, sharing expertise and investigating issues across multiple systems.

Software Development Intern

Oct. 2022 – April 2023

Matrox Imaging (Zebra)

- Implemented Guided Filter and Fast Guided Filter (C++/OpenCV) to replace bilateral filtering: reliable with slight speed gain (Guided); 2-3× faster at reduced precision (Fast Guided).
- Authored design documents, proof of viability, and integration into the Matrox Imaging Library (MIL).
- Extensive testing (unit, functional, and performance) prior to integration.

PERSONAL & ACADEMIC PROJECTS

Ticket Analyzer (YOLOv8)

[Personal Project / Solo]

FastAPI/OpenAPI backend for receipt data extraction using YOLOv8 (Labelme + Ultralytics). SQLite persistence, local-only execution for privacy. Vite+React+TS front-end.

Supermarket Price Comparer

[Personal Project / Solo]

Android app that scans product barcodes and compares prices across local stores. Functional prototype with REST API and database.

Qat Game

[Academic / Team Project]

2D narrative game developed with Unity3D (C#).

Facial Recognition

[Academic / Team Project]

Face recognition in video streams with email notifications and Blockchain storage. Python, OpenCV (Haar cascade classifiers).

EDUCATION

Master's in Computer Science - Video Game Option — Université du Québec à Chicoutimi (UQAC), 2023

French Engineering Degree - Computer Science, Image Processing — Télécom Saint-Étienne, 2023
